

Fogging Fan Systems

Fogging fans are the best solution for open areas, to provide air flow and cooling with the integrated systems of ventilation and fogging together, to ensure the best result against the unbearable high humidity in the hot season.

Essential for refreshing indoor or semi indoor rooms like nightclubs, bars, restaurants, alfresco dining, pergolas, workshops, factories, packing sheds, hire companies etc.

EuroJet

EuroJet is a combination of ventilation and fogging and has been developed by technical experts and industrial engineers to guarantee the best cooling of outdoor areas in hot ambient temperatures.

EuroJet systems operates by the principle of evaporative cooling, created by a fine fog, evaporating, lowering the temperature.

The Italian made pumps and super quiet fan won't disrupt the environment while creating an umbrella of cool, refreshing fog, gently dispersed into the air.

Available in either ceiling or pedestal mounted.

HOW IT WORKS:

Fogging systems all comprise of a 1 and 5 micron double water filter, with the water pressurised to 70 bar (1000 psi) and distributed along pressure pipes, then sprayed through special patented high pressure nozzles as an ultra fine mist of smaller than 10 micron droplets, which then evaporates instantly and refreshes the atmosphere.

This process is called thermal dynamics. Water needs energy to evaporate - 600 calories to evaporate one gram of water, and this exchange of energy causes the temperature to fall. Best results happen with high temperatures and low humidity.
